

RISK & RETURN IN INVESTING

Financial Mathematics • CA-III • Unit V and Unit VI

Name: Anhad Mahajan

PRN: 24070126031

Division: AIML-A

UNIT V: BASICS OF INVESTMENT

1. Investment Return

$$\text{HPR} = \frac{\text{Income} + V_f - V_i}{V_i} \times 100$$

Buy Rs 150, sell Rs 180,
dividend Rs 10:

$$\text{HPR} = 40 \div 150 = 26.67\%$$

2. Uneven Cash Flows

$$\text{NPV} = \sum C / (1 + k)^t - I$$

$I = \text{Rs } 1,00,000, k = 10\%$
(PVIF to 3 decimals)

$$\text{NPV} \approx 27,340 > 0: \text{accept}$$

3. Compound Frequency

$$A = P(1 + r/n)^{nt}$$

Continuous: $A = P e^{rt}$

Rs 5,00,000 at 8%, 1 year
(to nearest Rs)

How often	Rs after 1 yr
Yearly	5,40,000
Quarterly	5,41,216
Monthly	5,41,500
Continuous	5,41,644

4. Equivalence

$$FV = PV(1 + i)^n$$

At 10%: Rs 1,000 now
≡ Rs 1,331 after 3 years

UNIT VI: RISK AND UNCERTAINTY

1. Risk & Uncertainty

Risk = chance of a loss.

$$\sigma = \sqrt{\sum d^2 \div n}$$

$$\text{CV} = \sigma \div \text{mean} \times 100$$

12, 18, 20, 15, 25 (%)

$$\sigma = 4.43\%, \text{CV} = 24.6\%$$

2. Risk Premium

$$\text{Premium} = E(R) - R_f$$

$$\text{Sharpe} = (R_p - R_f) \div \sigma_p$$

$$12\% - 4\% = 8\%$$

$$\text{Sharpe} = 8 \div 10 = 0.8 (\sigma = 10\%)$$

3. Diversification

$$\sigma_p^2 = w_1^2 \sigma_1^2 + w_2^2 \sigma_2^2 + 2 w_1 w_2 \sigma_1 \sigma_2 \rho$$

$w = 0.5, 0.5; \sigma = 10\%, 15\%$

$$\rho = 0.25: \sigma_p^2 = 0.01$$

4. Life Insurance

$$\text{APV} = S \sum v^k P(T = k)$$

3-yr term, $S = 2,00,000, i = 5\%$

$P(T=1, 2, 3) = 0.003, 0.0025, 0.002$

$$\text{APV} = \text{Rs } 1,370.48$$

5. Endowment

Term + Pure endowment

Higher risk should
earn a higher
expected return
